

The recycled content of our hybrid aluminum/wpc boards is at least 70% post-consumer.

1. Aluminum makes up about 78% by weight. It is made of recycled material. The nature of aluminum is such that it is recycled over and over so that material that is sourced as post-industrial may have itself been sourced as post-consumer. In fact given this frequent turnover of aluminum, that is likely the case. However, we cannot attest to the percentages since no one tracks this, not even our most meticulous Japanese suppliers who are ISO certified.
2. The adhesive makes up 3% and it is all virgin.
3. The wpc makes up 18% of our boards by weight. They are generally over 70% post-consumer recycled material, both the thermo-resin and the wood content, with slight variations depending on color.

Please note that the total sums to 99% due to rounding.
